Improving the Effectiveness of Early Warning Systems for Drought:

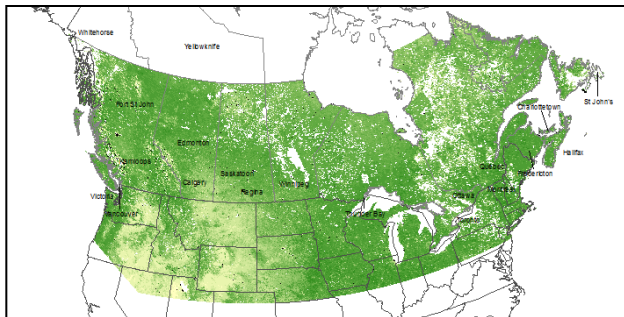

2020 Virtual Drought Summit, October 1, 2020

Canada

What is VegDRI?

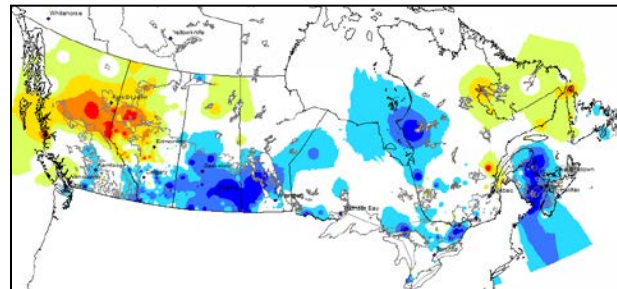

- Hybrid drought index that combines satellite observations of vegetation health with climate station information and land biophysical information to determine drought categories.
- The index looks at anomalies in crop growth and builds a model that relates these to precipitation and temperature anomalies.

Remote Sensing Component

Satellite Normalized Difference Vegetation Index (NDVI)

Climate Component

Standardized Precipitation Index (SPI)
Palmer Drought Severity Index (PDSI)

Biophysical Component

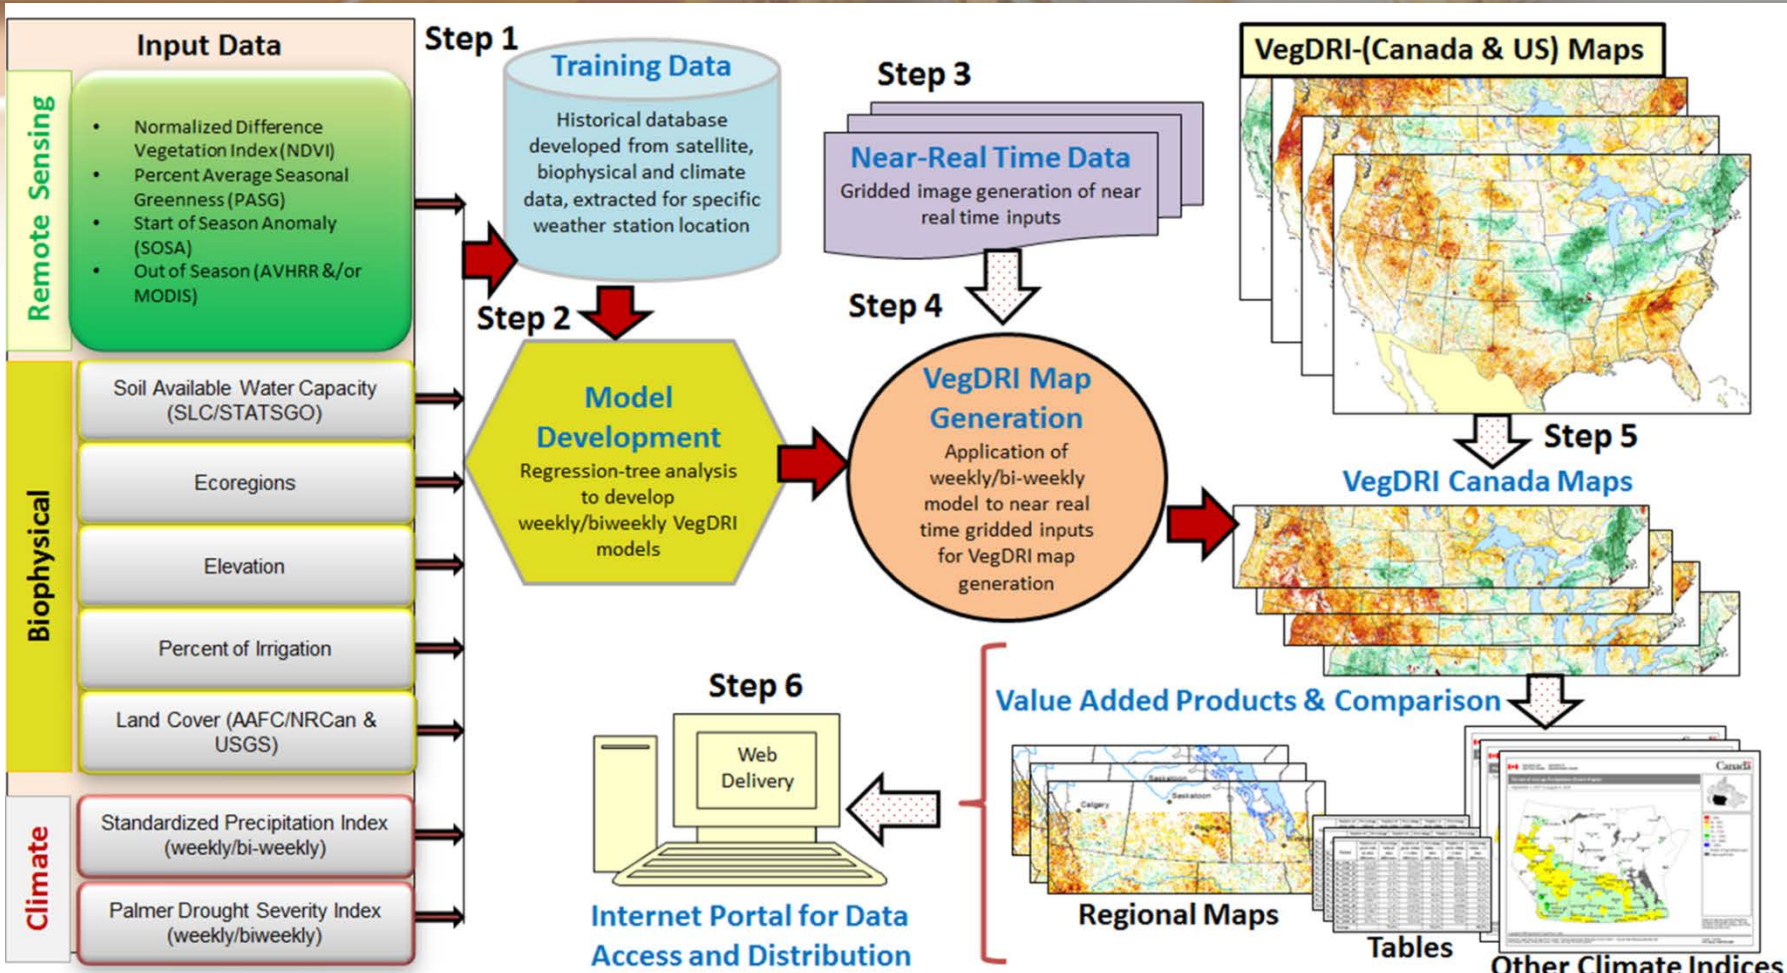

Land Cover; Irrigation; EcoZones;
Soil Water Holding Capacity

Vegetation Condition

	Extreme Drought		Unusually Moist
	Severe Drought		Very Moist
	Moderate Drought		Extreme Moist
	Pre-drought stress		Out of Season
	Near Normal		Water

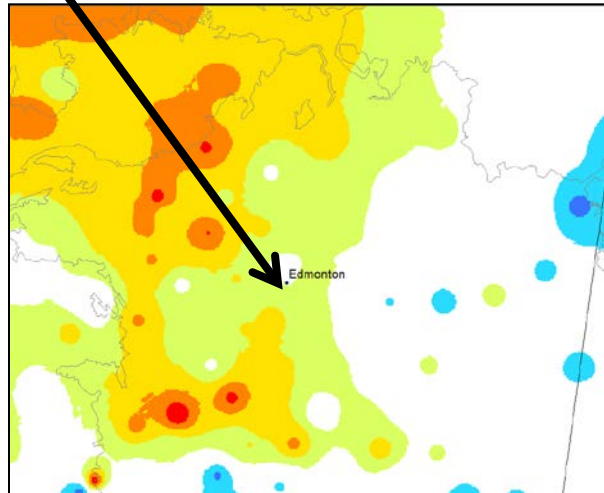

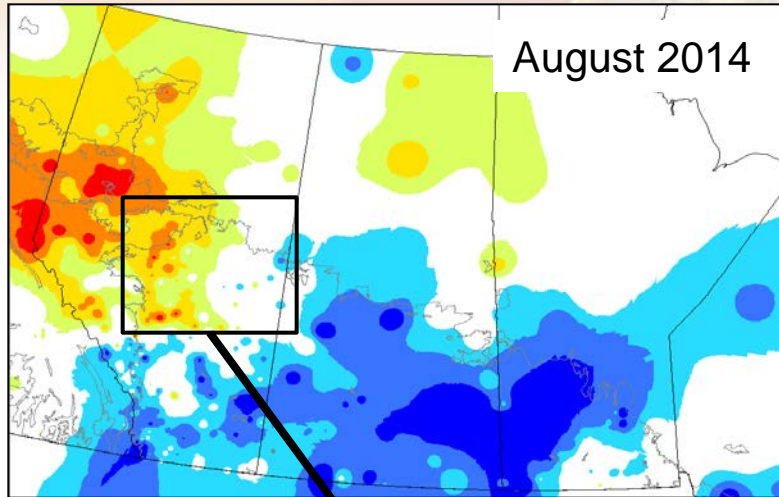

VegDRI Model Development (Tadesse et al 2015, 2017)...

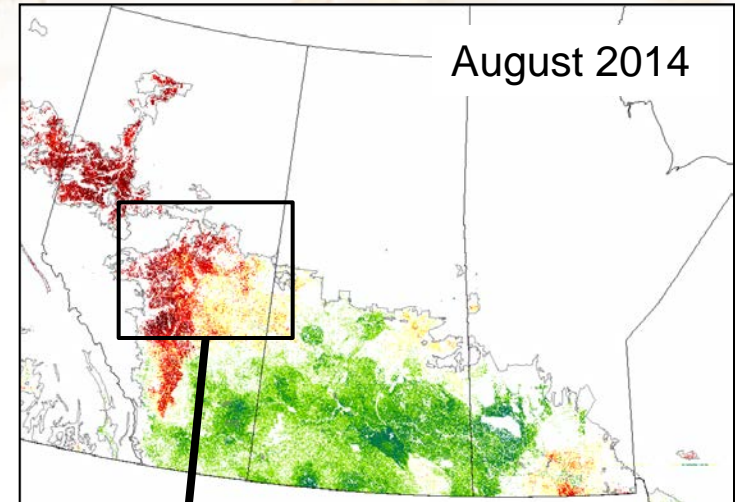

Tadesse, T., Champagne, C., Wardlow, B.D., Hadwen, T.A., Brown, J.F., Demisse, G.B., Bayissa, Y.A., & Davidson, A.M. (2017). Building the vegetation drought response index for Canada (VegDRI-Canada) to monitor agricultural drought: first results. *GIS Science & Remote Sensing*, pp1-28.

VegDRI provides higher spatial resolution on the impacts of drought...

Interpolated Standardized Precipitation Index (SPI)

Vegetation Drought Response Index (VegDRI)

Impact of Data Inputs on VegDRI

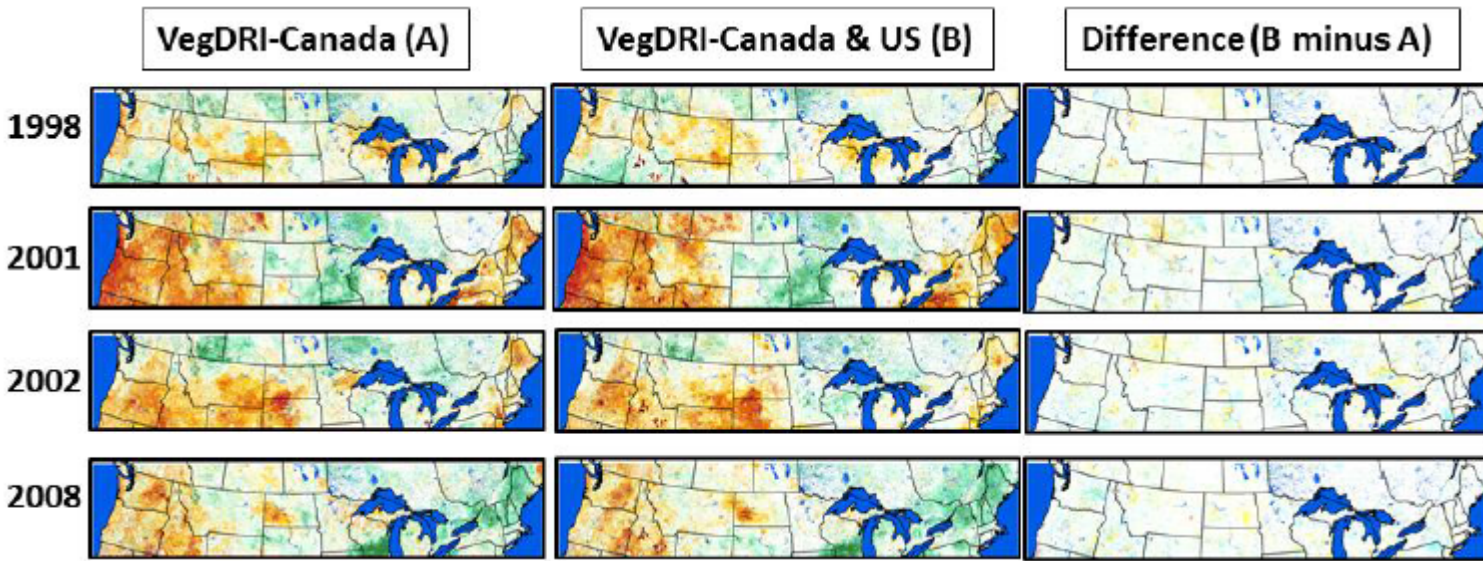

Difference Maps: (VegDRI-US & Canada) minus VegDRI-Canada [B-A] for Early Season (4 – 18 Jun)

August 2020 VegDRI – CDM Comparison

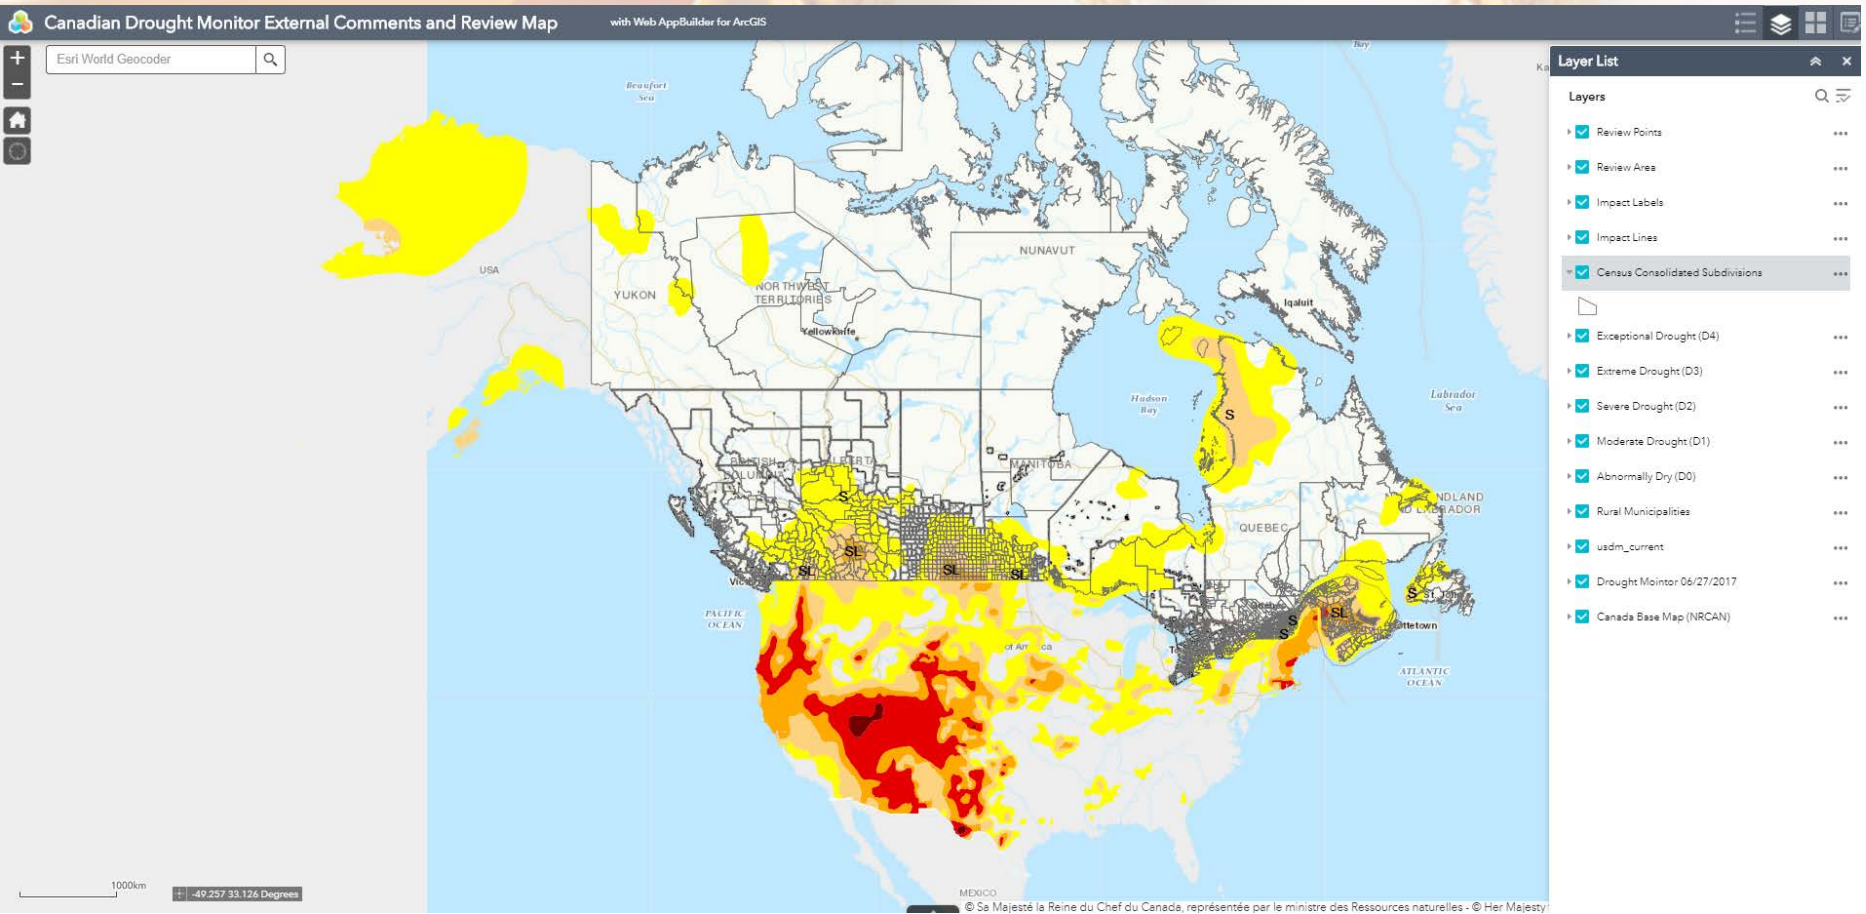

The Canadian VegDRI will be released and posted regularly on Drought Watch website www.agr.gc.ca/drought in 2021

The Evaporative Stress Index (ESI)

- The ESI describes temporal anomalies in ET, highlighting areas with high or low rates of water use.
- The ESI has the capability for capturing early signals of “flash drought”, brought on by extended periods of hot, dry and windy conditions leading to rapid soil moisture depletion.

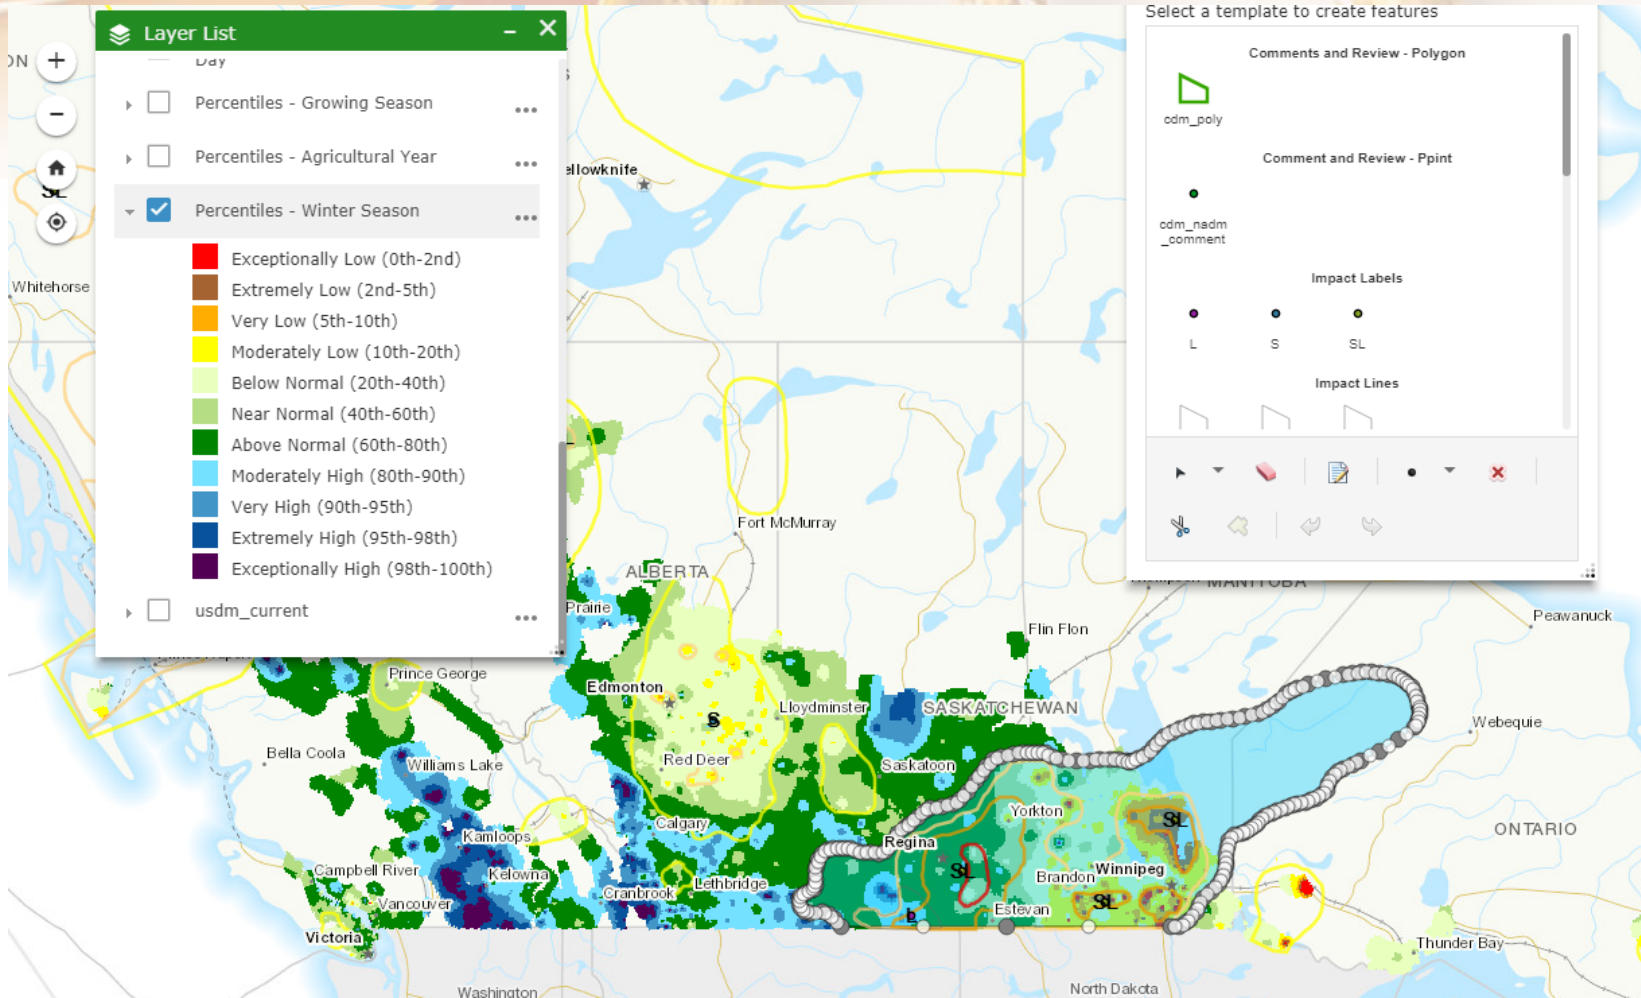

CDM Reviewer Application

Objective Blends and Drought Indices Table

- The goal of this project is to develop a Table that would provide a quick assessment of each indicator for each climate station in the country.
- The table would incorporate the indicators into short and long term objective blends
- The stations could then be displayed as a service on our CDM editor application or an application on our website.

The high-level approach

- Use existing forecasts from ECCC MSC (one month forecasts to start, then seasonal) to produce various drought indices.
- Create and automate a system to classify areas of intensity of drought based on the CDM classifications using a blend of the forecast indices.
- Develop output product(s) that show forecast conditions

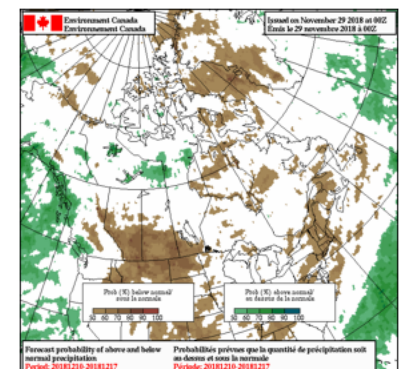

Drought Outlook Data Sources

- GEPS Forecast (<http://dd.weather.gc.ca/ensemble/geps/>)
 - Forecasts in 3/6 hour steps to 16/32 days
 - Regularly spaced ~0.5 degree resolution
 - 21 ensemble members

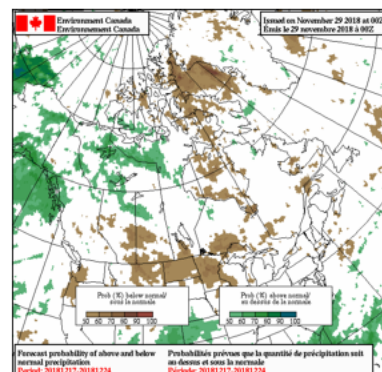

Week 1

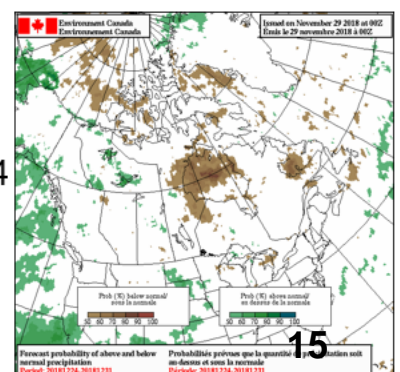

Week 2

Week 3

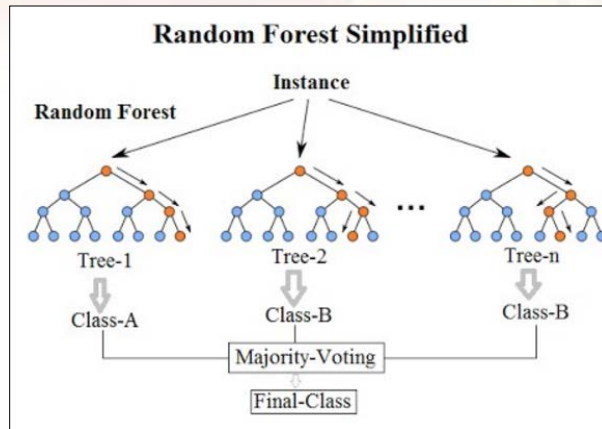

Week 4

Drought Outlook

- “Forest” made of up of random partial decision trees

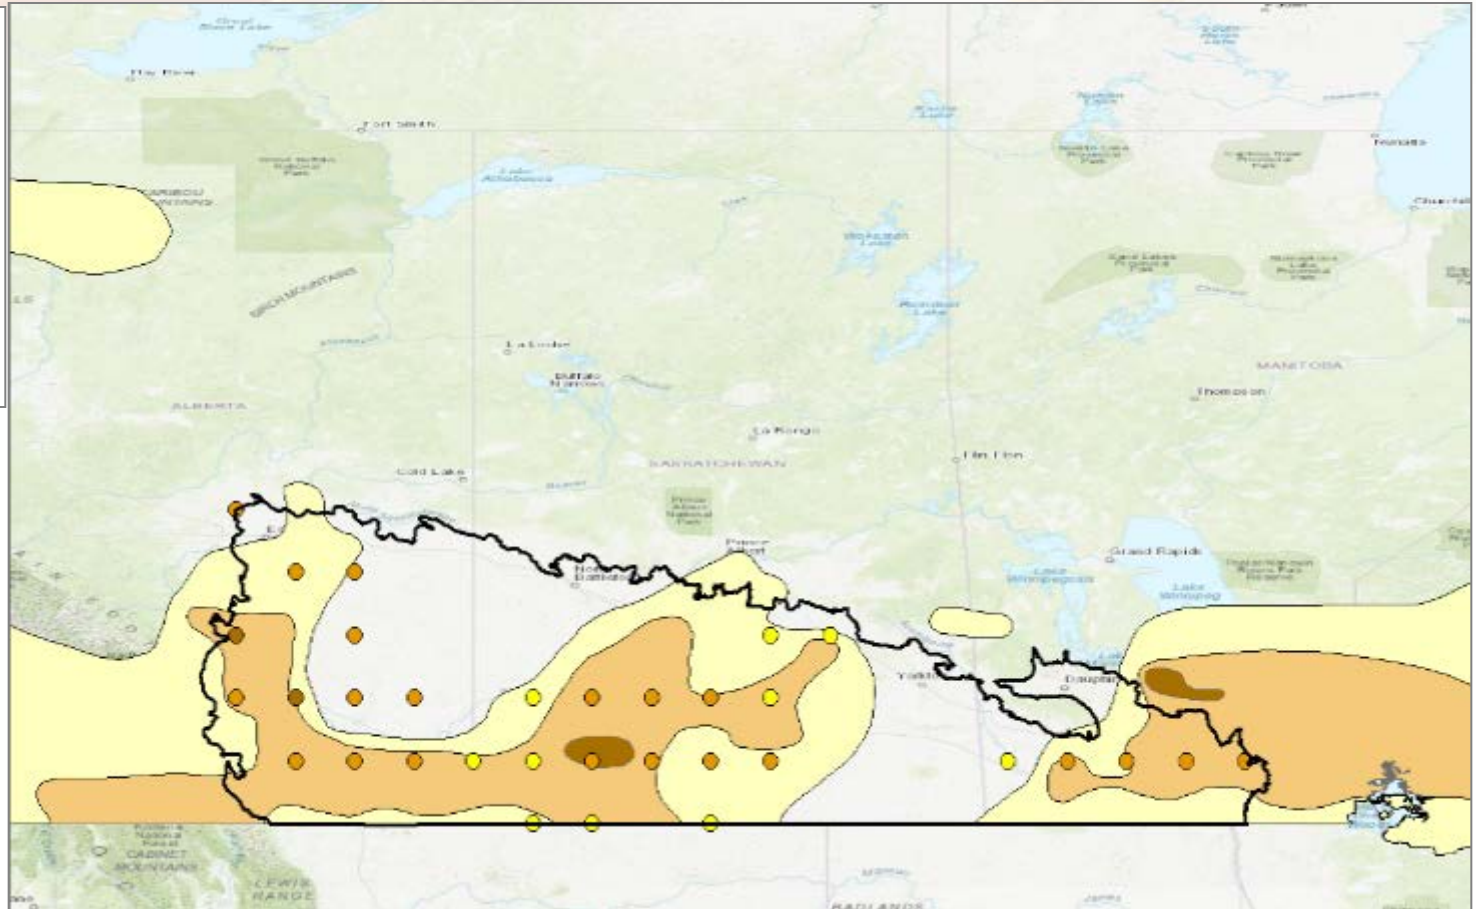

Trained machine learning algorithm

- Drought indices (2004-2015)
- Historical CDM (2004-2015)
- Auxiliary data (Ecozones map, month, etc)

- Uses all available information to classify drought
- Apply trained Machine Learning to predict drought
 - Forecasted drought indices created from GEPS data
